

EEG for the veterinary community

With Trackit Mk3, R40 or the Trackit T4A:

- Routine EEG
- Lab quality recording
- Video Option

Diagnosing Epilepsy and Seizures in Animals

Veterinarians struggle with many of the same issues with dogs, cats, and even horses that physicians do when diagnosing epilepsy and seizures in their human patients.

These include:

- Standardization of epilepsy definition
- Classification
- Terminology

While EEG recordings remain very useful, the challenges in diagnosing animals include:

- Electrode placement
- Best type of electrodes
- Optimal number of EEG channels
- Testing in ambulatory home environments vs. clinic
- Access to EEG experts

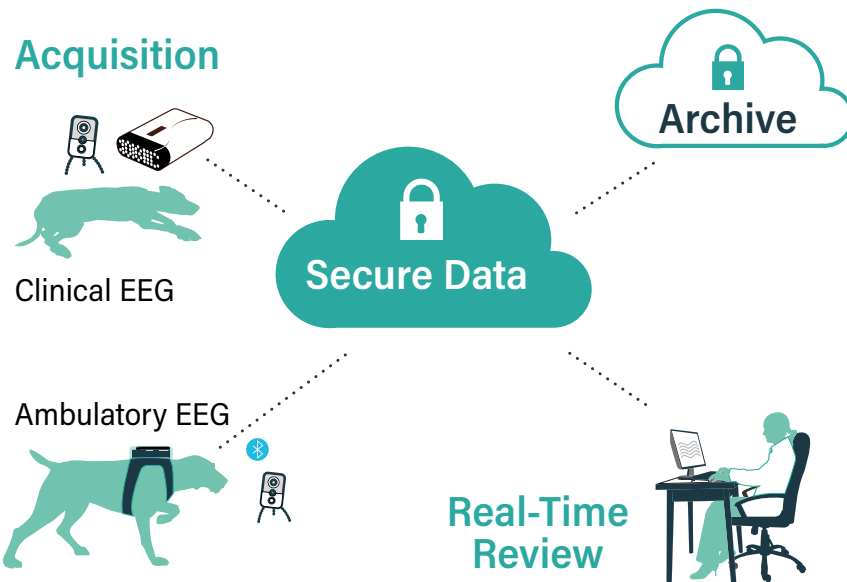

EEG Solutions for Veterinarians

EEG solutions enhance animal care

Lifelines Neuro brings proven experience supporting veterinary medicine. With a dedicated support staff and nationwide access to practicing veterinarians and researchers, Lifelines Neuro's Veterinary EEG services can help you make accurate and timely diagnoses for seizures and epilepsy.

Our EEG solutions benefit both traditional veterinary practices and academic research facilities.

- Wireless technology and synchronized video allow your patients to roam freely while undergoing EEG studies.
- The Trackit V Video EEG System has the added benefit of preventing the animal from getting tangled up in cables – and even better – without the need to give sedation during the recording.
- The R40 amplifier with its excellent signal quality is ideal when more channels are needed, and/or animals are in a fixed, non-ambulatory setting.
